

Linear Circuits and Systems

**Review of Sinusoids**

Course: Linear Circuits and Systems  
Dr. Ahmed Dallal  
Electrical and Computer Engineering  
University of Pittsburgh

2

## Nominal form of a sinusoid

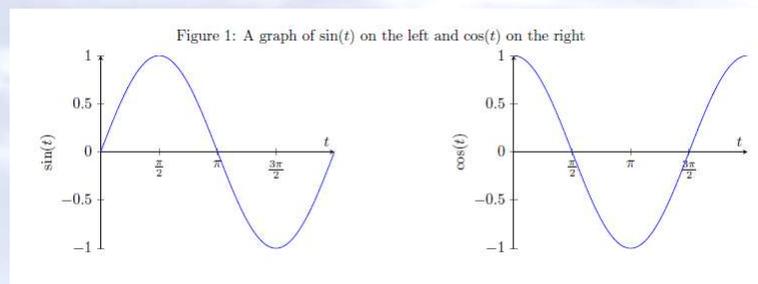

- A typical sinusoid is represented as

$$A \cos(\omega t + \phi) \text{ or} \\ A \sin(\omega t + \phi)$$

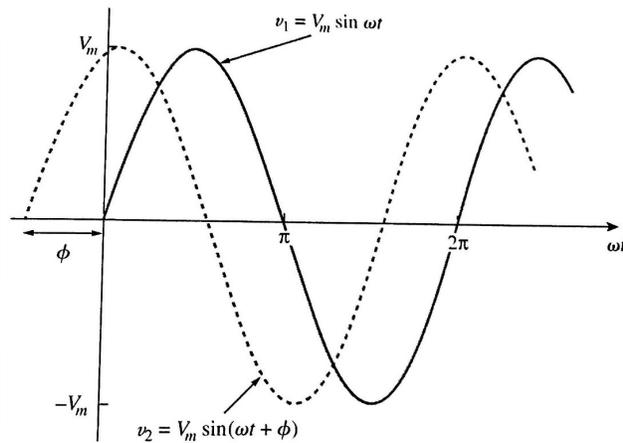

**A:** Amplitude

**$\omega$ :** Angular frequency

**$\phi$ :** Phase shift

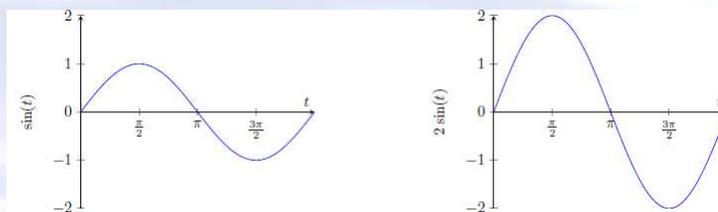

## Sinusoidally alternating voltage

Two voltage sinusoids with same frequency and amplitude, but different phases

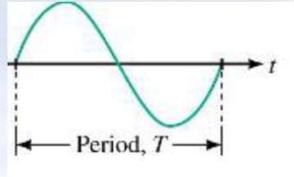

## Amplitude

- The **amplitude** of a sinusoid wave is the distance from its average value to its peak

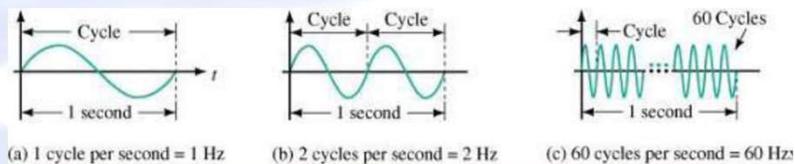

## Period

- The period ( $T$ ) is the time taken to complete one full cycle.

## Period and Frequency

- The frequency ( $f$ ) is the number of cycles per second.
  - The unit of frequency is **hertz (Hz)**.
  - 1 Hz = 1 cycle per second.

## Period and Frequency

- The period and the frequency are related by the formula

$$f = \frac{1}{T}$$

## Angular Frequency, $\omega$

- $\omega$  is a measure of the angular velocity of the sinusoid.
  - It has units of rad/sec
  - Changes to  $\omega$  affect sinusoids in the same way changes to  $f$

$$\omega = 2\pi f \quad (\text{rad/s})$$

$$\omega = 2\pi f = \frac{2\pi}{T} \quad (\text{rad/s})$$

## Phase shift, $\phi$

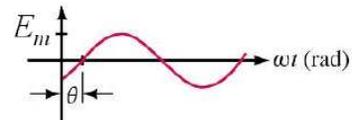

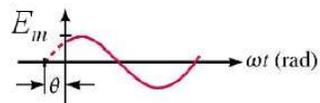

- Phase shift encodes the time shift in sinusoids
- Changing  $\phi$  shifts a sinusoid to the left or the right.

If  $e$  is shifted left (Leading), then

$$e = E_m \sin(\omega t + \theta)$$

If  $e$  is shifted right (Lagging), then

$$e = E_m \sin(\omega t - \theta)$$

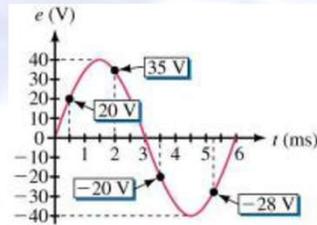

## Phase shift, $\phi$

- Phase shift  $\phi$  corresponds to shifting the signal  $T_0$  seconds.
- The time shift,  $T_0$ , is related to  $\phi$  as follows:

$$T_0 = \frac{\phi}{\omega} = \frac{\phi}{2\pi f} = \frac{\phi T}{2\pi}$$

## Instantaneous value

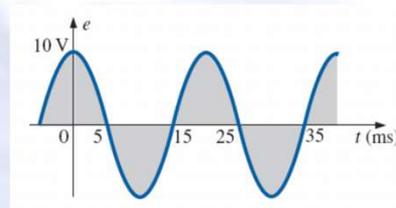

- The **instantaneous value** of a sinusoid is the value of the sinusoid at a particular instant in time.

- We obtain the instantaneous value by at a particular time  $t_0$  by substituting  $t_0$  for  $t$  in the sinusoid equation

## Example I

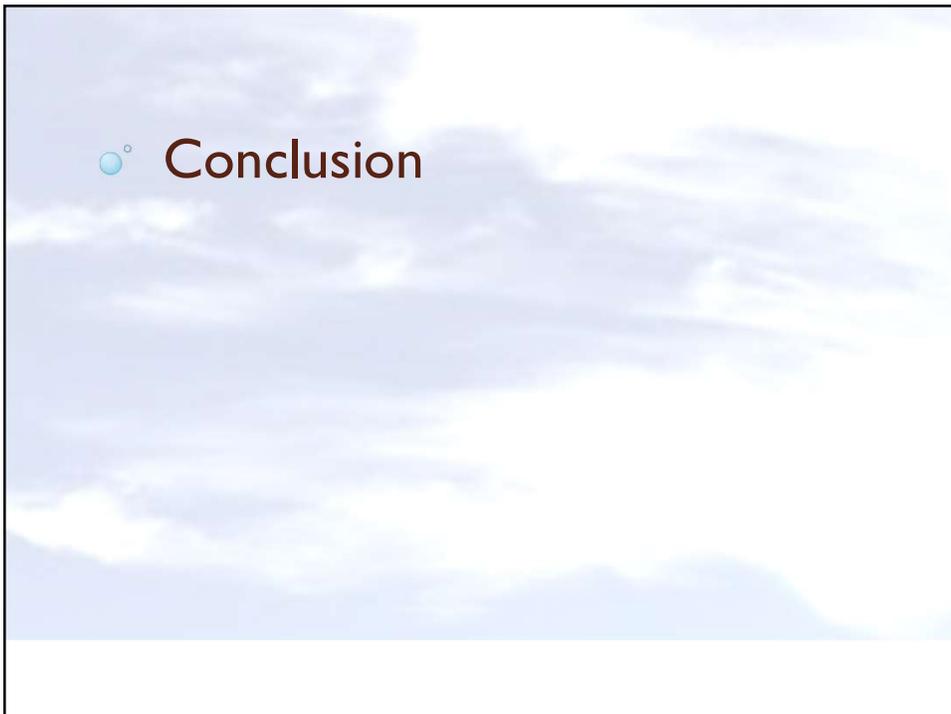

- The signal on the right is defined as  $A \sin(\omega t + \phi)$
- Determine the value of  $A$ ,  $\omega$ , and  $\phi$ .

## Example 2

- A sine wave has a frequency of 100 Hz, phase shift of 0, and an instantaneous value of 100V at 1.25 msec. What is the voltage at 2.5 msec?
